React Project

Using the following api https://restcountries.com/ , create an app that makes the following:

- The goal is to create an app where user can have access to informations of a country in the world . The data must come from the api

- In the first part User can select a region of the globe (Africa, Americas, Asia, Europe, Oceania)

- After selecting the region he wants, he can access all the countries from that region

- After selecting the country he can access information about that country

- Create the possibility to select/unselect countries. They should appear in a sidebar. All
the insert/remove operations should use the Redux store

- Create a search field in both parts (main countries list and sidebar selected countries list)
